# Finite Projective Planes

$X$ : finite set of points,

$\mathcal{L}$ : finite set of lines.

- Any two lines intersect in one point;
- Any two points on one line;
- Non-degenerate.

$\text{PG}(2, p)$  (Desarguesian finite projective plane):

- Points: 1-dimensional subspaces of  $\mathbb{F}_p^3$ .
- Lines: 2-dimensional subspaces.
- Each line contains  $p + 1$  points, each point on  $p + 1$  lines.

Two parallel lines will intersect at infinity.

# Incidence Matrix

## Incidence Matrix:

$$A_p = (a_{ij})$$
$$a_{ij} = \begin{cases} 1, & \text{if the point } i \text{ is on the line } j \\ 0, & \text{otherwise} \end{cases}$$

**$p$ -rank (the rank over  $\mathbb{F}_p$ ) of the incidence matrix:**

In  $\text{PG}(2, p)$ ,  $p$  prime:

$$p\text{-rank of the } A_p \text{ is } \binom{p+1}{2} + 1 = \frac{p(p+1)}{2} + 1.$$

*Example:* An incidence matrix  $A_3$  of  $\text{PG}(2, 3)$  is

$$A_3 = \begin{pmatrix} 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}.$$

The 3-rank of  $A_3$  is  $\frac{3(3+1)}{2} + 1 = 7$ .

# Moorhouse basis

Example: An incidence matrix  $A_3$  of  $\text{PG}(2, 3)$  is

$$A_3 = \begin{pmatrix} 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}.$$

The rank of  $A_3$  is  $\frac{3(3+1)}{2} + 1 = 7$ .

- Fix a row arbitrarily (here 1st row is fixed).
- Fix an arbitrary ordering of the positions where there is a one in that row (for example  $a_1 = 7, a_2 = 1, a_3 = 5, a_4 = 2$ ).
- Remove some arbitrary  $p + 1 - i$  rows with a one in position  $a_i$  (except for the fixed row).

This gives a row basis of the matrix  $A_p$ .

Any such row basis is known as a **Moorhouse basis**.

# Repair locality

**Repair group** for a position: set of other positions that can reconstruct its information.

**Repair locality** of a position: size of its smallest repair group.

For a code from  $\text{PG}(2, p)$ :

**Codeword length** is  $p^2 + p + 1$ .

$p + 1$  points on a line means repair locality of every symbol is  $p$ .

*Example:* An incidence matrix  $A_3$  of  $\text{PG}(2, 3)$  is

$$A_3 = \begin{pmatrix} 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}.$$

$(b_1, b_2, b_3, b_4, b_5, b_6, b_7, b_8, b_9, b_{10}, b_{11}, b_{12}, b_{13})$

From the first row,

For coded symbol  $b_5$ , a repair group is  $\{b_1, b_2, b_7\}$ ;

For coded symbol  $b_1$ , a repair group is  $\{b_2, b_5, b_7\}$ ;

For coded symbol  $b_7$ , a repair group is  $\{b_1, b_2, b_5\}$ ;

# Repair availability

**Repair availability:** maximum number of disjoint repair groups.

The  $p + 1$  lines through a point form  $p + 1$  **disjoint** repair groups for the corresponding position.

The repair groups are:

$\{b_1, b_5, b_7\}$  by looking at row 1;

$\{b_3, b_6, b_8\}$  by looking at row 2;

# Update in coded storage

# Update efficiency

**Update efficiency:** the number of coded symbols that need to be updated when updating a data symbol.

**The update efficiency of the code:** the maximum update efficiency for each data symbol.

For a code from  $PG(2, p)$ :

**Codeword length** is  $p^2 + p + 1$ .

The update efficiency is  $2p$ .

$$G_3^{(1)} = \begin{pmatrix} 1 & 1 & 0 & 0 & 1 & -1 & 0 & 0 & 0 & -1 & 0 & -1 & 0 \\ 1 & 1 & 0 & 0 & 1 & 0 & 0 & -1 & 0 & 0 & -1 & 0 & -1 \\ 0 & 1 & 1 & 0 & 0 & 0 & -1 & 1 & 0 & -1 & 0 & -1 & 0 \\ 0 & 0 & 1 & 1 & 0 & -1 & 0 & 0 & 1 & -1 & 0 & -1 & 0 \\ 0 & 0 & 0 & 1 & 1 & 0 & -1 & 0 & 0 & 1 & -1 & 0 & -1 \\ 0 & 0 & 0 & 0 & 1 & 1 & -1 & -1 & 1 & 0 & 0 & 0 & -1 \end{pmatrix}$$

# Circulant structure

## Circulant structure:

Rows of the matrix are the cyclic shifts of one row.

The incidence matrix of  $\text{PG}(2, p)$  always has the circulant structure (from the Singer cycle).

**Example** with  $p = 2$ :

$$\begin{pmatrix} 1 & 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 & 1 & 0 & 1 \\ 1 & 0 & 0 & 0 & 1 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 1 & 1 \\ 1 & 0 & 1 & 0 & 0 & 0 & 1 \end{pmatrix}$$

- Repair this coded symbol from the other coded symbols of the line.

Specifically, the coded symbol is repaired to minus the sum of the other coded symbols of the line (over  $\mathbb{F}_p$ ).

$$A_3 = \begin{pmatrix} 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}.$$

$$(b_1, b_2, b_3, b_4, b_5, b_6, b_7, b_8, b_9, b_{10}, b_{11}, b_{12}, b_{13})$$

# Stopping sets

The **stopping sets** (**sets without tangents**) are the sets of projective points intersecting no line in exactly one point.

## Example:

Erased coded symbols:  $\{b_2, b_3, b_5, b_6, b_7, b_8\}$ .

It is the union of two lines through  $b_1$ , without  $b_1$ .

**Algorithm A** never manages to repair any of those servers.

$$A_3 = \begin{pmatrix} 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}.$$

The smallest size  $s_p$  of a set without tangents or stopping set:

$$p + \frac{1}{4}\sqrt{2p} + 2 \leq s_p \leq 2p - 2$$

For small odd  $p$ :

$$s_3 = 6,$$

$$s_5 = 10,$$

$$s_7 = 12,$$

$$s_9 = 15,$$

$$s_{11} = 18.$$

While  $s_{11} = 18$ , the smallest stopping sets our experiments encountered for  $p = 11$  had size 27.

This means smaller stopping sets are very rare.

## Conclusion

Explicit codes with efficient updates, good repair locality and good repair availability.

Allows different choices for  $G$ , i.e. support for unequal update frequencies.

1. We recalled the  $\mathbb{F}_p$ -linear code with parity-checks given by the rows of the incidence matrix of  $\text{PG}(2, p)$ . A parity-check matrix is obtained e.g. via a Moorhouse basis.
2. We propose a method to obtain the generator matrix via tree construction.
3. The repair locality is  $p$ , and the repair availability is  $p + 1$ , while the number of coded symbols is  $p^2 + p + 1$ .
4. We can use different generator matrices depending on update frequencies of symbols, to reduce the maximum update frequency of a coded symbol.
5. The incidence matrix is circulant.
6. We designed the repair algorithm from the incidence matrix and discussed stopping sets.

The recovery of any individual data symbols from a small number of coded symbols.
